

Strict Compiler Option

As I explained in the previous lesson, the **strict** option enables a range of type-checking behavior. The exact settings affected by this are dependent on the version of the TypeScript compiler you're using. The newer versions may introduce additional stricter checking under this flag so upgrading the TypeScript compiler may result in new errors.

You can see the exact options enabled by turning on the strict setting here:

<https://www.typescriptlang.org/tsconfig#strict>

You'll gradually get familiar with these settings as we go through the course.
